INTRODUCTION

The NOAA Ship *Gordon Gunter* departed Pascagoula, MS on 19 April 2008 to initiate the Southeast Area Monitoring and Assessment Program (SEAMAP) Spring Ichthyoplankton Survey in the northern Gulf of Mexico. The SEAMAP Program is a cooperative State/Federal/University program designed to collect biological and environmental data from waters of the U.S. Gulf of Mexico. During the Spring Survey, plankton samples are collected from a systematic grid of stations to assess distribution, occurrence and abundance of the early life stages of a variety of species of fishes and invertebrates. The survey specifically targets larval bluefin tuna (*Thunnus thynnus*).

A total of 39 successful sea days were worked over two legs during the cruise: Leg 1, April 19 – May 8 and Leg 2, May 11 – 30, 2008. An unscheduled 1 day port call occurred on May 18 to repair a leaking sewage pipe.

OBJECTIVES

1. Assess the occurrence, abundance and geographical distribution of the early life stages of spring spawning fishes, especially bluefin tuna (*Thunnus thynnus*), from the continental shelf edge to deep Gulf waters using a bongo frame fitted with 0.335 mm nets and a neuston frame fitted with a 0.947 mm net at selected SEAMAP stations in support of annual stock assessments. Targeted sampling for bluefin tuna larvae was also done at the end of Leg 1 where directed eddy sampling occurred near frontal circulation features based on satellite imagery of sea surface temperature and surface chlorophyll data. Stations were placed on cross-front transects to cover both outside, on the edges and inside the eddy.
2. Describe the pelagic habitat of fish larvae through measurements of various physical and biological parameters.
 - a) Record profiles through the water column of temperature, salinity, fluorescence, dissolved oxygen, and turbidity using a CTD at SEAMAP stations.
 - b) Measure chlorophyll *a* in replicate water samples taken at surface, mid or maximum chlorophyll layer and near bottom (to a maximum of 200 m) depths using bench top fluorometry.
 - c) Detect and measure frontal features along the survey cruise track using data from the ship's Fluoro-thermosalinograph flow-through system (TSG) and the Acoustic Doppler Current Profiler (ADCP).
3. To assist in the collection of marine debris from plankton samples for the Plankton & Plastic Surveys of U.S. Ocean Waters project with the National Fish and Wildlife Foundation.

METHODS

Environmental Data Collection

Environmental data were collected at each designated ichthyoplankton station in accordance with procedures outlined in the SEAMAP data collections manual. Each station included a CTD cast to near bottom or a maximum depth of 200 m except for the directed sampling stations where CTD casts were to a maximum depth of 500 m. The Seabird SBE 9/11 Plus CTD with SBE digiquartz pressure sensor was used with a dual suite of the following sensors: SBE 03 temperature sensor, SBE 04 conductivity sensor, and SBE 43 dissolved oxygen sensor. Only a single Wetlabs Wetstar fluorometer and Wetlabs C-Star transmissometer were used because of space limitations on the CTD plumbing. Information from shipboard sensors was accessed via the Scientific Computer System (SCS), which continuously displayed and recorded the ship's position, heading, speed, wind direction, wind speed, barometric pressure, sea surface temperature, air temperature and water depth. Each sampling event was conducted through the SCS and data (environmental and biological) for bongos, neuston, and CTD were then ingested into Microsoft Access for later analysis. Data from the TSG events were recorded and saved, but not ingested into the Microsoft Access database at this time. Water samples were taken, using Niskin bottles attached to a carousel sampler, at the surface, midwater or chlorophyll maximum, and near-bottom (up to 200 m maximum) for bench top fluorometric analysis using a modified Welshmeyer method. The modified procedure uses a Turner Designs 10-AU-005 benchtop fluorometer with a 10-040R optical kit. Temperature, salinity and depth were recorded in real time during bongo net tows using a Seabird SBE19 SEACAT Profiler.

Ichthyoplankton Sample Collection

Ichthyoplankton sample and data collection were implemented in accordance with procedures outlined in the SEAMAP data collections manual. A predefined cruise track of 97 SEAMAP stations approximately 30 nautical miles apart in a systematic grid pattern were targeted for each leg of the survey. However, the Leg 1 transect was broken off early to conduct directed sampling in eddy areas where adult bluefin tuna are known to spawn. Primary station operations consisted of a CTD profile, a neuston tow and every other station, a bongo tow with attached (on towing cable above the frame) SEACAT Profiler. Bongo samples were taken with the standard SEAMAP 61 cm bongo outfitted with two 0.335 mm mesh nets and towed in an oblique path from near bottom or 200 m maximum depth to the surface. Vessel speed was adjusted during the bongo tow to maintain a 45-degree wire angle in order to uniformly sample the water column. Water temperature, salinity and depth were monitored and recorded real-time during each bongo tow. Each bongo net had a flowmeter mounted inside to measure the volume filtered during the oblique tow. Neuston samples were taken using a 0.947 mm mesh net attached to a 1 x 2 m metal frame and towed for 10 minutes at a vessel speed (~ 2 knts) sufficient to keep the net opening half submerged in the water and thus maintaining a sampling depth of 0.5 m. Tows were shortened to no less than 5 minutes if *Sargassum* began to accumulate in the net and make retrieval onto the deck difficult. Right bongo samples were initially preserved in 10% formalin and transferred to new 95% Ethanol (ETOH) after 48 hours. Left bongo and neuston

samples were initially preserved in 95% ETOH and transferred to fresh ETOH after 24 hours.

As part of a NASA funded grant, directed sampling efforts targeting bluefin tuna larvae occurred during the last week of Leg 1; May 1-7. These non-standard stations were chosen to cross frontal features of the Loop Current and associated cyclonic and anticyclonic eddies. These mesoscale oceanographic features were located based on satellite imagery of sea surface temperature and surface chlorophyll. Daily updates of MODUS based imagery products were examined twice a day to track movements of these features and to position the ship. Shipboard CTD profiles and TSG data were sent daily to the Miami laboratory from the beginning of the cruise until the end of Leg 1 to assist in the determination of sampling locations. Standard SEAMAP gear and updated preservation techniques were used for all samples, including the directed sampling stations.

Secondary Samples

A request was made by an independent researcher who is collaborating with the American Chemistry Council and other NOAA laboratories to save any plastics caught in our sampling gear. The plastic samples will be sent with all station information to the independent researcher for further analysis.

To accommodate a dissertation project by a University of Michigan graduate student (Celia Christianson), neuston samples were scanned with the naked eye for two cnidarians, *Velella* and *Porpita*, and two mollusks, *Glaucus* and *Janthina* and the marine insect, *Halobates*. As passive drifters, these organisms are sometimes captured in our neuston samples. The collected specimens will represent the North Atlantic gyre in this multi-ocean study, Historical Ecology of the Neuston, which looks at the associations between populations of these taxa. Captured specimens were removed from the neuston samples and initially preserved in 95% ETOH, then transferred to new 95% ETOH after 24 hrs. The DNA will be extracted from the specimens and the polymerase chain reaction (PCR) will be used to amplify genes in the O'Foighil lab at the University of Michigan in order to build gene trees and compare lineages of the taxa from the other ocean gyres.

A recently installed autonomous underway CO₂ system on the NOAA ship Gordon Gunter will be used to study ocean acidification in the Gulf of Mexico and Caribbean Sea. As part of this effort, a request was made by scientists from AOML (Atlantic Oceanographic and Meteorological Laboratory) and Texas A&M to collect co-located water samples to complement the CO₂ data from the system on the Gunter. In support of this effort, 40 water samples were collected from SEAMAP stations along the standard trackline during the second leg.

SURVEY RESULTS

Environmental Data

Two hundred and thirty five, SBE 9/11 plus CTD and 102, SBE 19 SEACAT profiles were taken during the cruise. The SBE 9/11 plus CTD profiles were post-processed at sea by the Field Party Chief using Seabird's SEASAVE processing software. All environmental data and

data from the ship's SCS were returned to the NMFS Pascagoula Laboratory for editing, analysis and archival storage. TSG events were run to detect the presence of surface fronts and were emailed to Miami daily to help determine sampling areas for the directed eddy portion of the cruise. These data and the ADCP data were also returned to the NMFS Pascagoula Laboratory for editing, analysis and archival storage. The 40 water samples for the ocean acidification study were returned to the requesting researchers for analysis (Table 5).

Table 1. Summary of environmental data recorded near the surface (≤ 5 m depth) using CTD sensors and fluorometric analysis during Leg 1 of the *Gordon Gunter* cruise 08-02 (48), 19 April – 08 May 2008.

Measurement	Mean	Minimum	Maximum	No. of Samples
Sea Temperature ($^{\circ}$ C)	25.339	20.844	27.792	115
Salinity (ppt)	36.296	35.646	36.488	115
Dissolved Oxygen (mg/l)	6.447	6.171	6.994	115
Chlorophyll a (μ g/l)	0.089	0.003	0.163	100

Table 2. Summary of environmental data recorded near the surface (≤ 5 m depth) using CTD sensors and fluorometric analysis during Leg 2 of the *Gordon Gunter* cruise 08-02 (48), 11 – 30 May 2008.

Measurement	Mean	Minimum	Maximum	No. of Samples
Sea Temperature ($^{\circ}$ C)	26.508	23.403	28.103	97
Salinity (ppt)	35.710	31.391	36.582	97
Dissolved Oxygen (mg/l)	6.302	6.223	6.996	97
Chlorophyll a (μ g/l)	0.137	0.038	1.243	97

Plankton Samples

NMFS Vessels:

Over the course of the *Gordon Gunter* survey, ichthyoplankton samples were collected at 157 of the original 194 planned SEAMAP stations (Figures 6 and 7; Table 7 and 8). Additional stations from the directed bluefin eddy study on Leg 1 resulted in 108 samples (Figures 8-15). The combined stations from Leg 1 and Leg 2 resulted in the collection of 203 bongo samples (101 right and 102 left), and 221 neuston samples.

Table 3. Summary of ichthyoplankton collections taken during *Gordon Gunter* cruise GU-08-02 (48), 19 April – 30 May 2008.

Leg	CTD casts	Right - Bongo	Left – Bongo	Neuston
1	59	31	31	60
1 BF	56	22	22	64
2	97	48	49	97
Totals	212	101	102	221

State Vessels:

Directed eddy sampling was also conducted by the state of Mississippi for this survey.

Archival Storage:

Plankton samples taken with the bongo and neuston were assigned SEAMAP numbers at sea (Federal samples). All right bongos and standard neustons will be shipped to ZSIOP Gdynia, Poland for sorting. Left bongo samples will be deposited in the SEAMAP Invertebrate Archive at Gulf Coast Research Laboratory, University of Southern Mississippi, Ocean Springs, MS for archival. Left bongo and neuston samples from the directed eddy sampling will be shipped to the Miami lab for sorting and identification.

Secondary Samples

Cnidaria / Mollusks:

Taxa collected from one left bongo and neuston samples during Leg 2 for the Univ. of Michigan dissertation project during this survey are as follows: 44 *Halobates* were collected at 9 stations, 55 *Porpita* were collected from 8 stations and 9 *Janthina* were collected at 4 stations. Station 159 (B005) contained *Halobates* in both the left bongo and the neuston. These specimens will be shipped to the Mollusk Division at the University of Michigan Museum of Zoology. The specimens pictured below were collected during the Winter Plankton Survey (GU-07-02) March 2007. Photos courtesy of C. Schobernd.

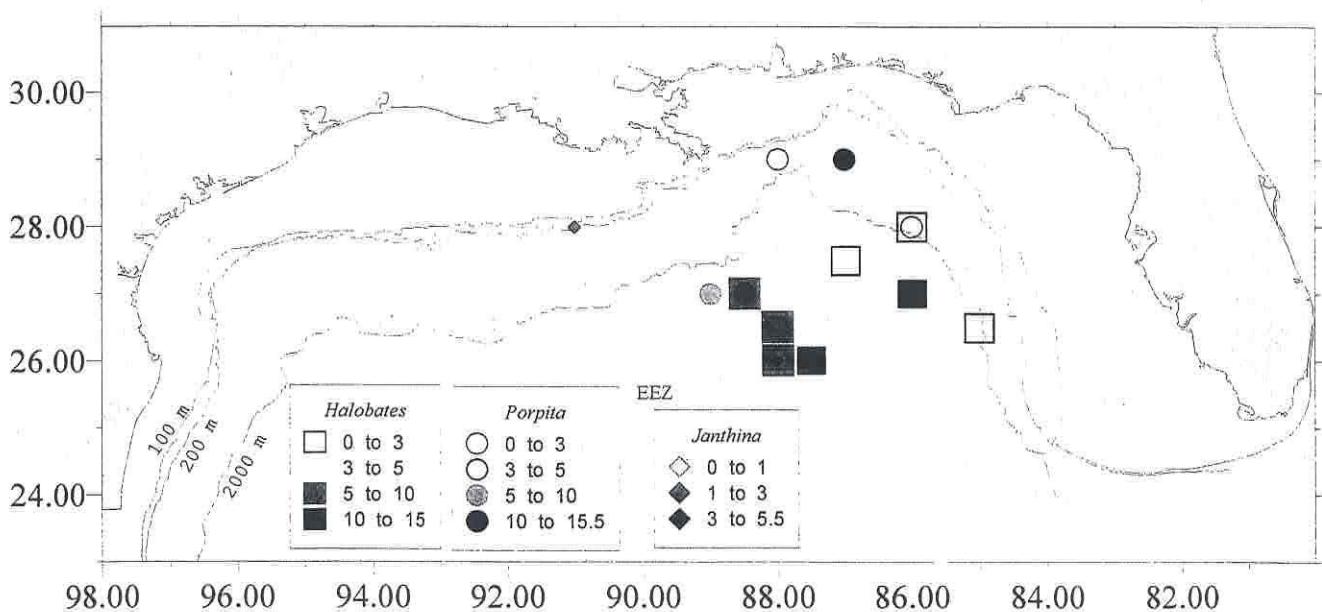

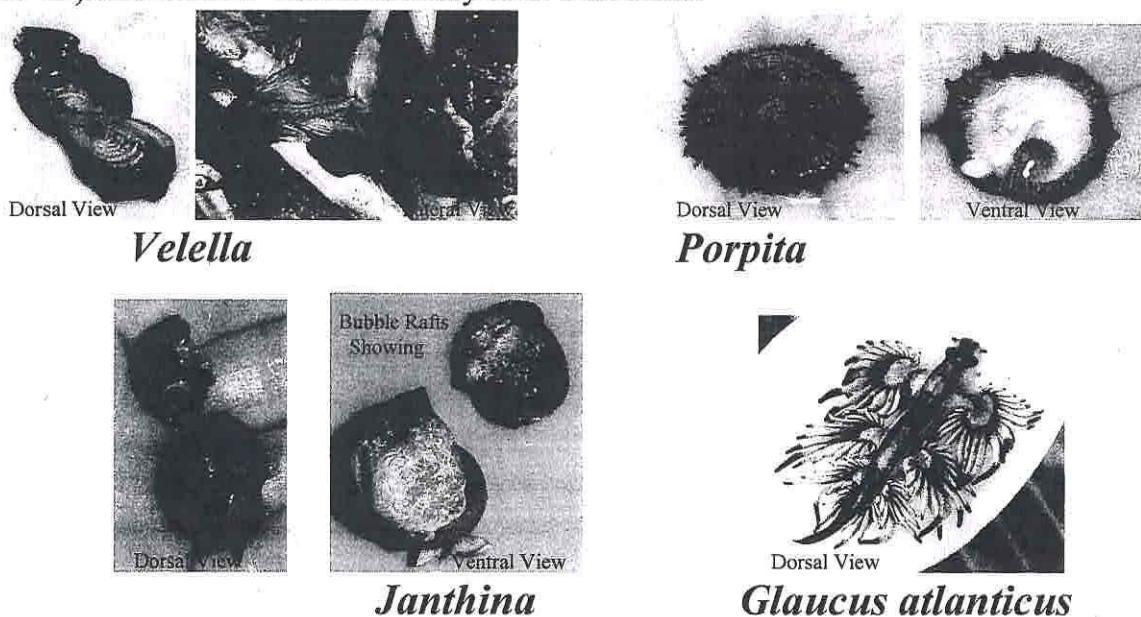

Figure 1. Neuston stations where cnidarians and mollusks were removed for the dissertation study. The diamonds represent *Halobates*, the circles represent *Porpita*, and the squares represent *Janthina*.

Table 7. Summary of average chlorophyll *a* measurements at 3 depths (surface, midwater or chlorophyll maximum, and bottom) for each station during Leg 2 of the Spring SEAMAP Plankton Survey conducted from the NOAA Ship *Gordon Gunter*, cruise GU-08-02 (48), 11 – 30 May 2008. P-Sta.# = Pascagoula station number; S-Sta.# = SEAMAP station number; Depth = Sample Depth (meters); D-Code = Sample location (meters) in water column (S = Surface, M = Midwater, Max = Chlorophyll maximum, B = Bottom, N/A = No sample at that depth); Chl-a = Chlorophyll *a* measurement ($\mu\text{g/liter}$).

Table 8. Summary of plankton sampling effort during the Spring SEAMAP Ichthyoplankton Survey conducted from the NOAA Ship *Gordon Gunter*, cruise GU-08-02 (48), Leg 1, 19 April – 8 May 2008. P-Sta.# = Pascagoula station number; S-Sta.# = SEAMAP station number; Smp.# = SEAMAP sample number; * represents SEAMAP samples where plastics were removed; RB = Right Bongo; LB = Left Bongo; NN = Neuston; Pres. = Initial preservative; Form = Formalin; ETOH = Ethyl alcohol.

A.**B.**

Figure 2. Chlorophyll *a* concentrations ($\mu\text{g/l}$) near the surface (\leq m depth) at SEAMAP plankton stations obtained during the 2008 SEAMAP Spring Plankton Survey aboard the NOAA Ship *Gordon Gunter* cruise GU-08-02 (48). Leg 1 data shown in plate A was collected during 19 April-8 May 2008. Leg 2 data shown in plate B was collected during 11-30 May 2007. Empty squares denote where CTD profile is available, but surface water samples were not retrieved.

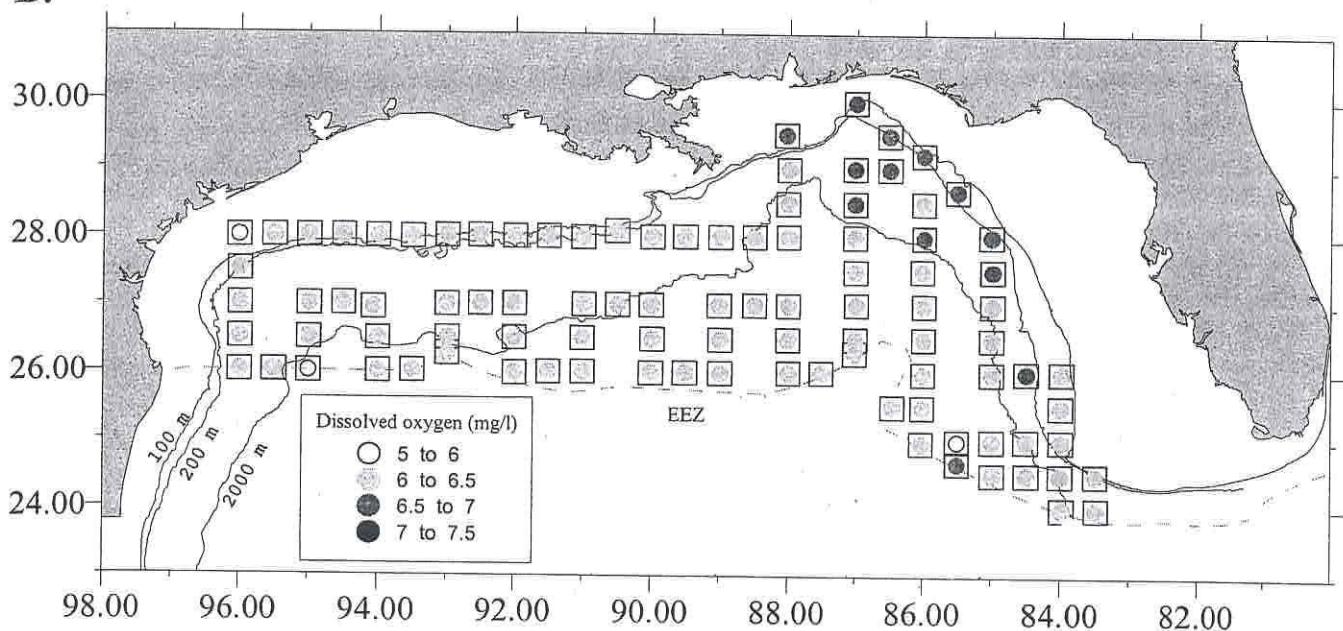

Figure 5. Dissolved oxygen (mg/l) near the surface (\leq m depth) at SEAMAP plankton stations obtained during the 2008 SEAMAP Spring Plankton Survey aboard the NOAA Ship *Gordon Gunter* cruise GU-08-02 (48). Leg 1 data shown in plate A was collected with a CTD during 19 April-8 May 2008. Leg 2 data shown in plate B was collected with a CTD during 11-30 May 2008.

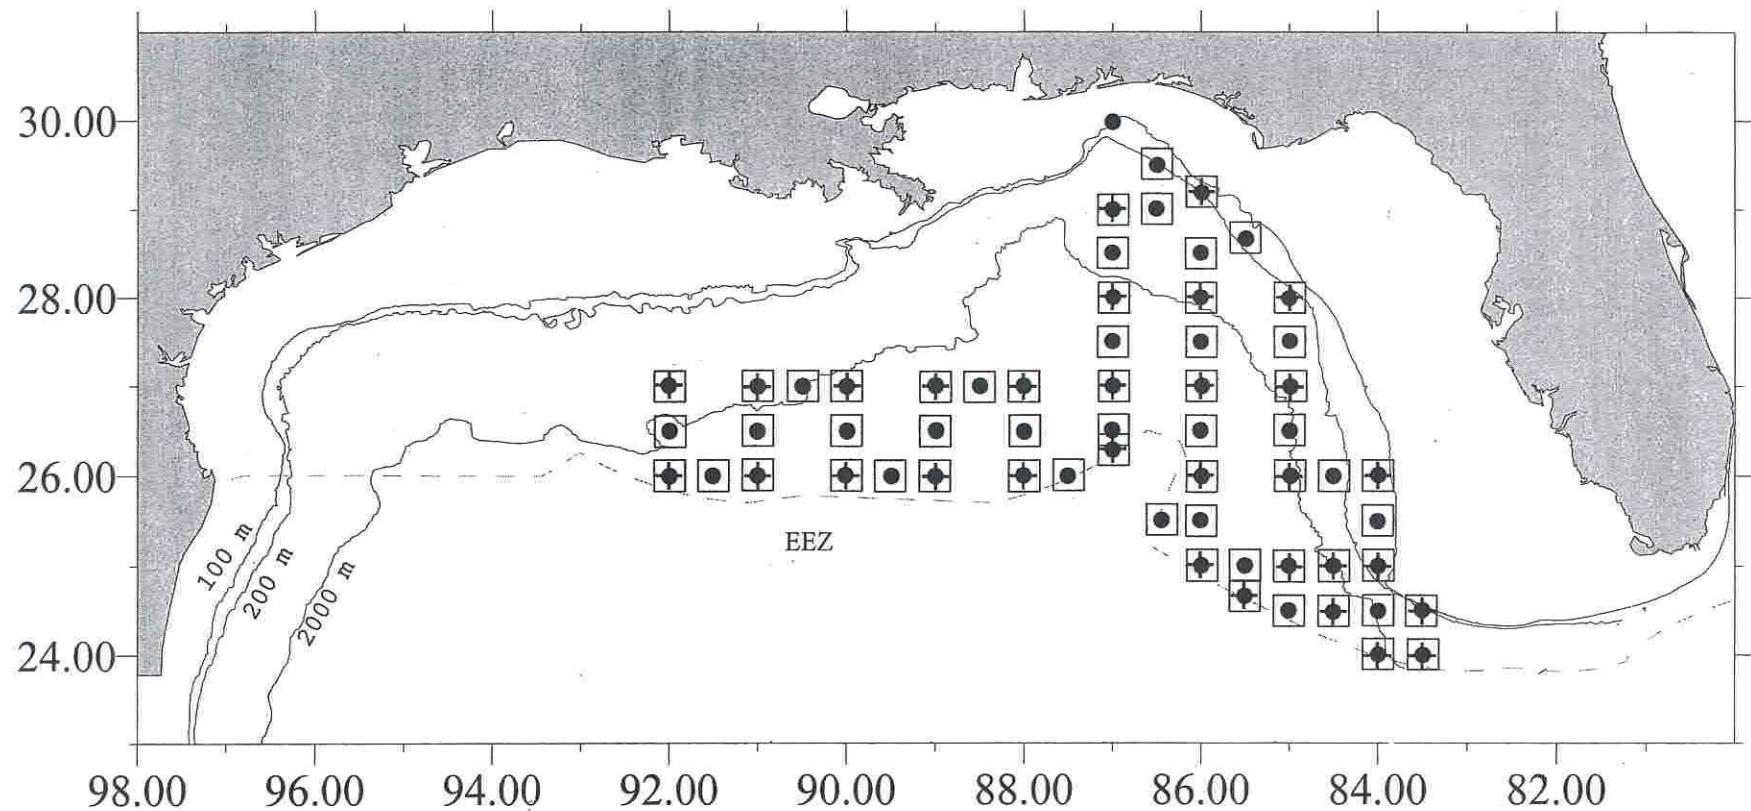

Figure 6. Stations occupied during Leg 1 of the 2008 SEAMAP Spring Plankton Survey. Dots represent completed neuston stations of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48), 19 April-8 May, 2008. The pluses represent stations where bongo tows were completed. Squares represent stations where an environmental profile was taken using the SBE 9/11 CTD.

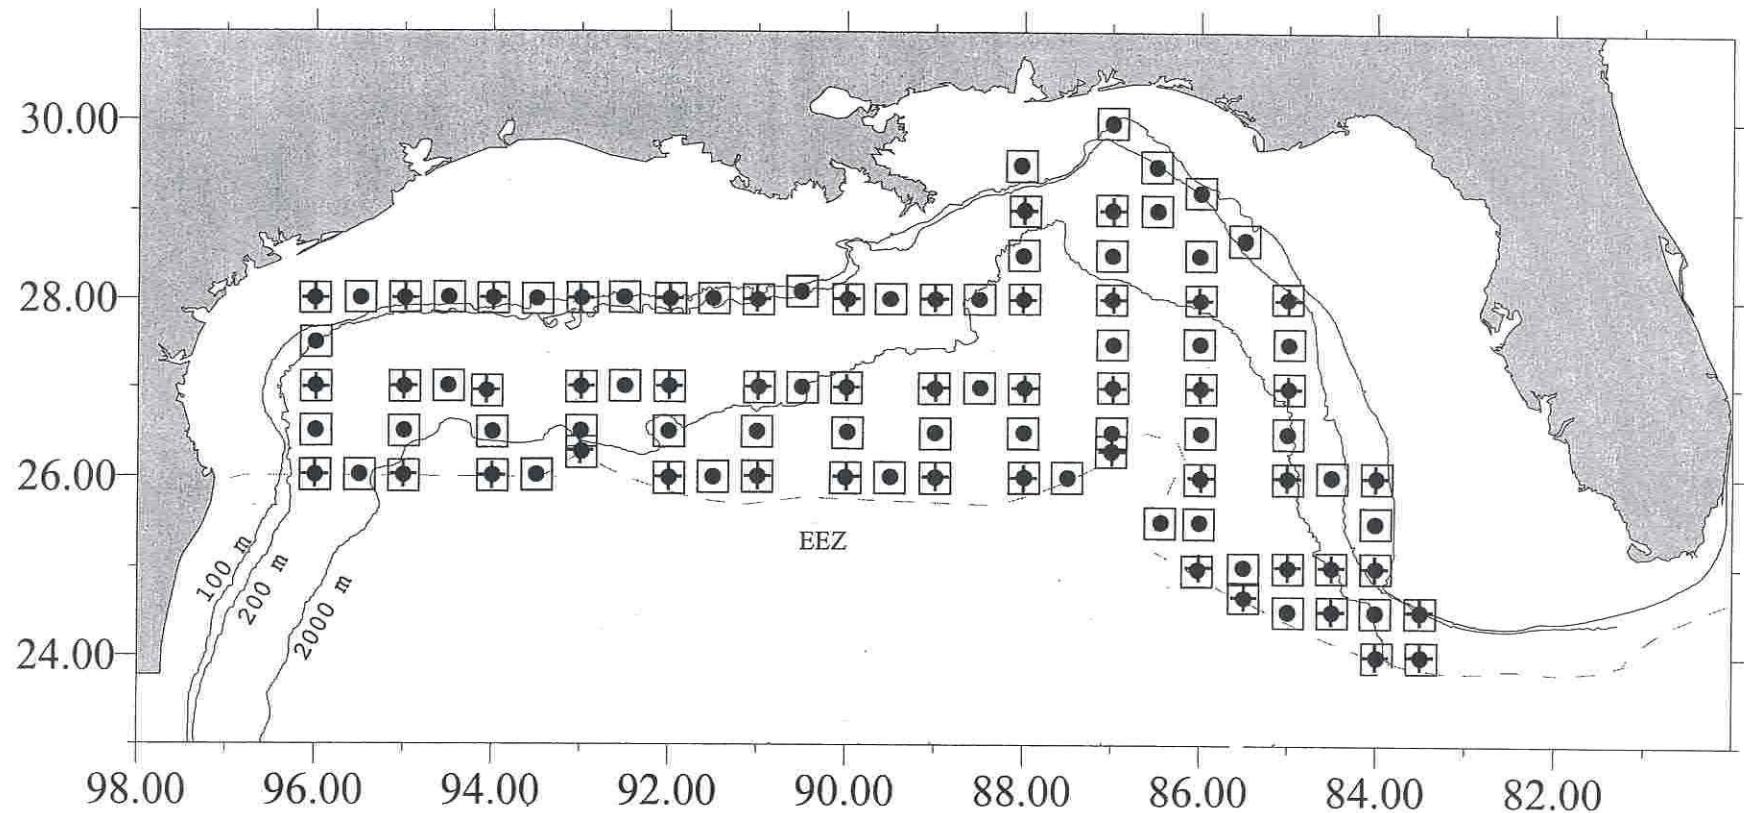

Figure 7. Stations occupied during Leg 2 of the 2008 SEAMAP Spring Ichthyoplankton Survey. Dots represent completed neuston stations of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48), May 11-30, 2008. The pluses represent stations where bongo tows were completed. Squares represent stations where an environmental profile was collected using the SBE 9/11 CTD.

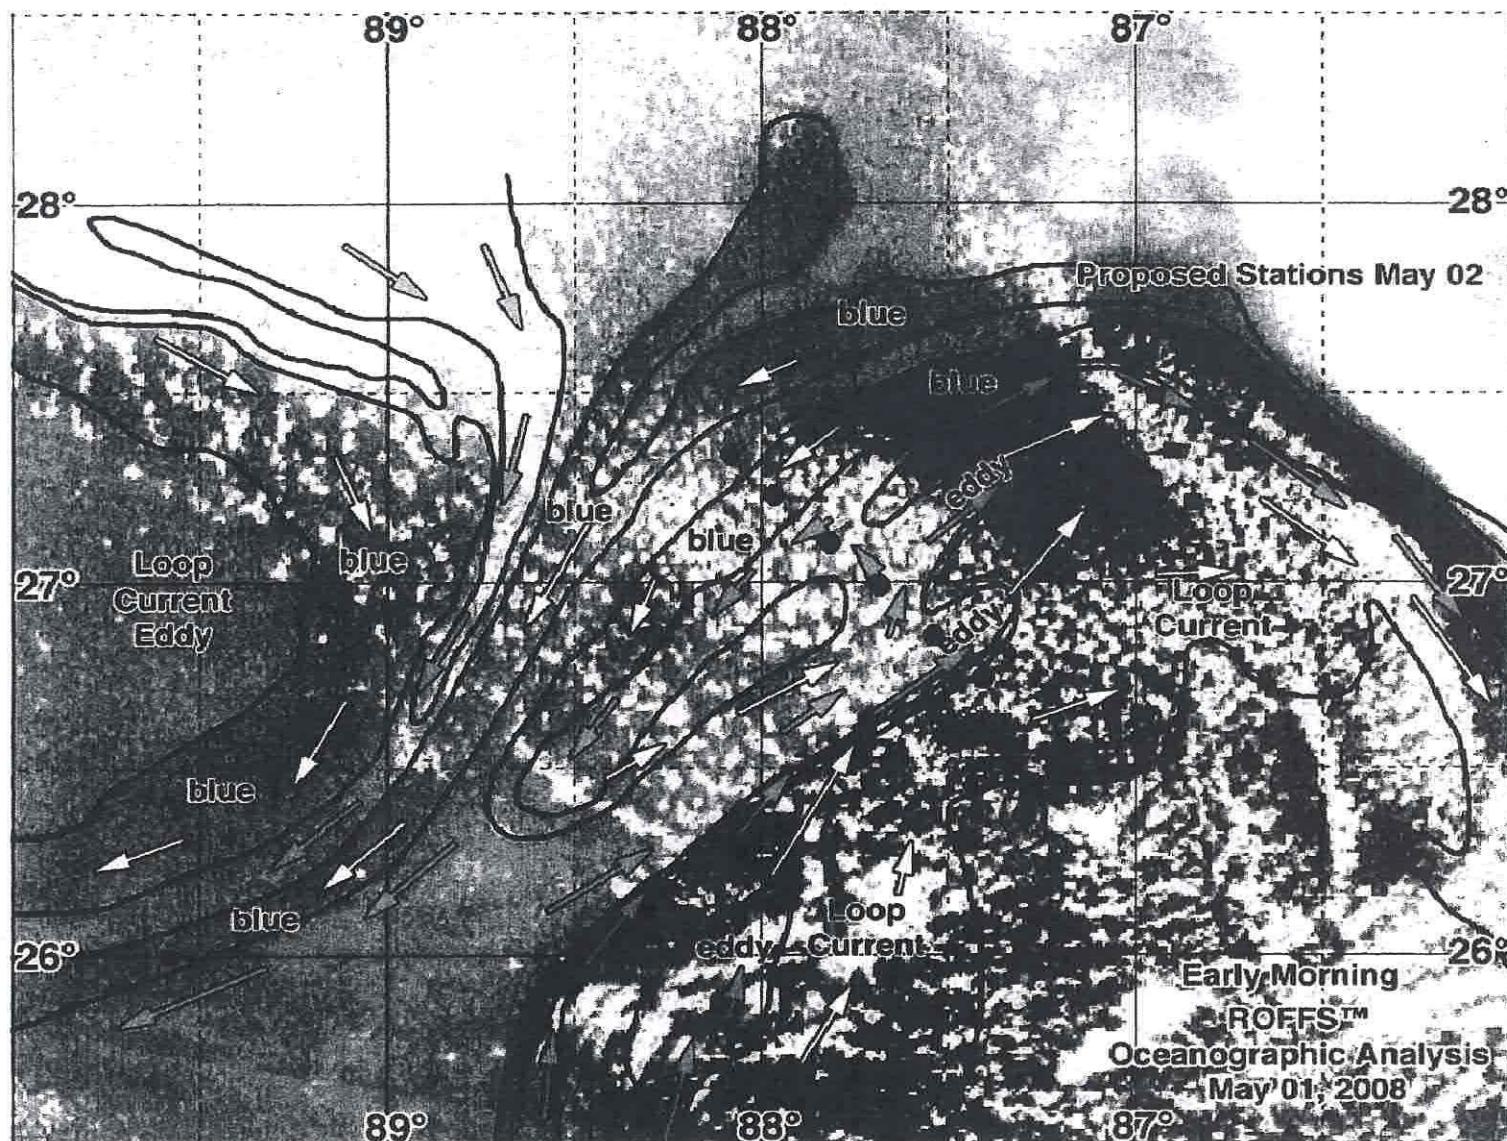

Figure 8. Transect stations (dark purple dots) occupied on 01 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48) plotted on sea surface temperature satellite image.

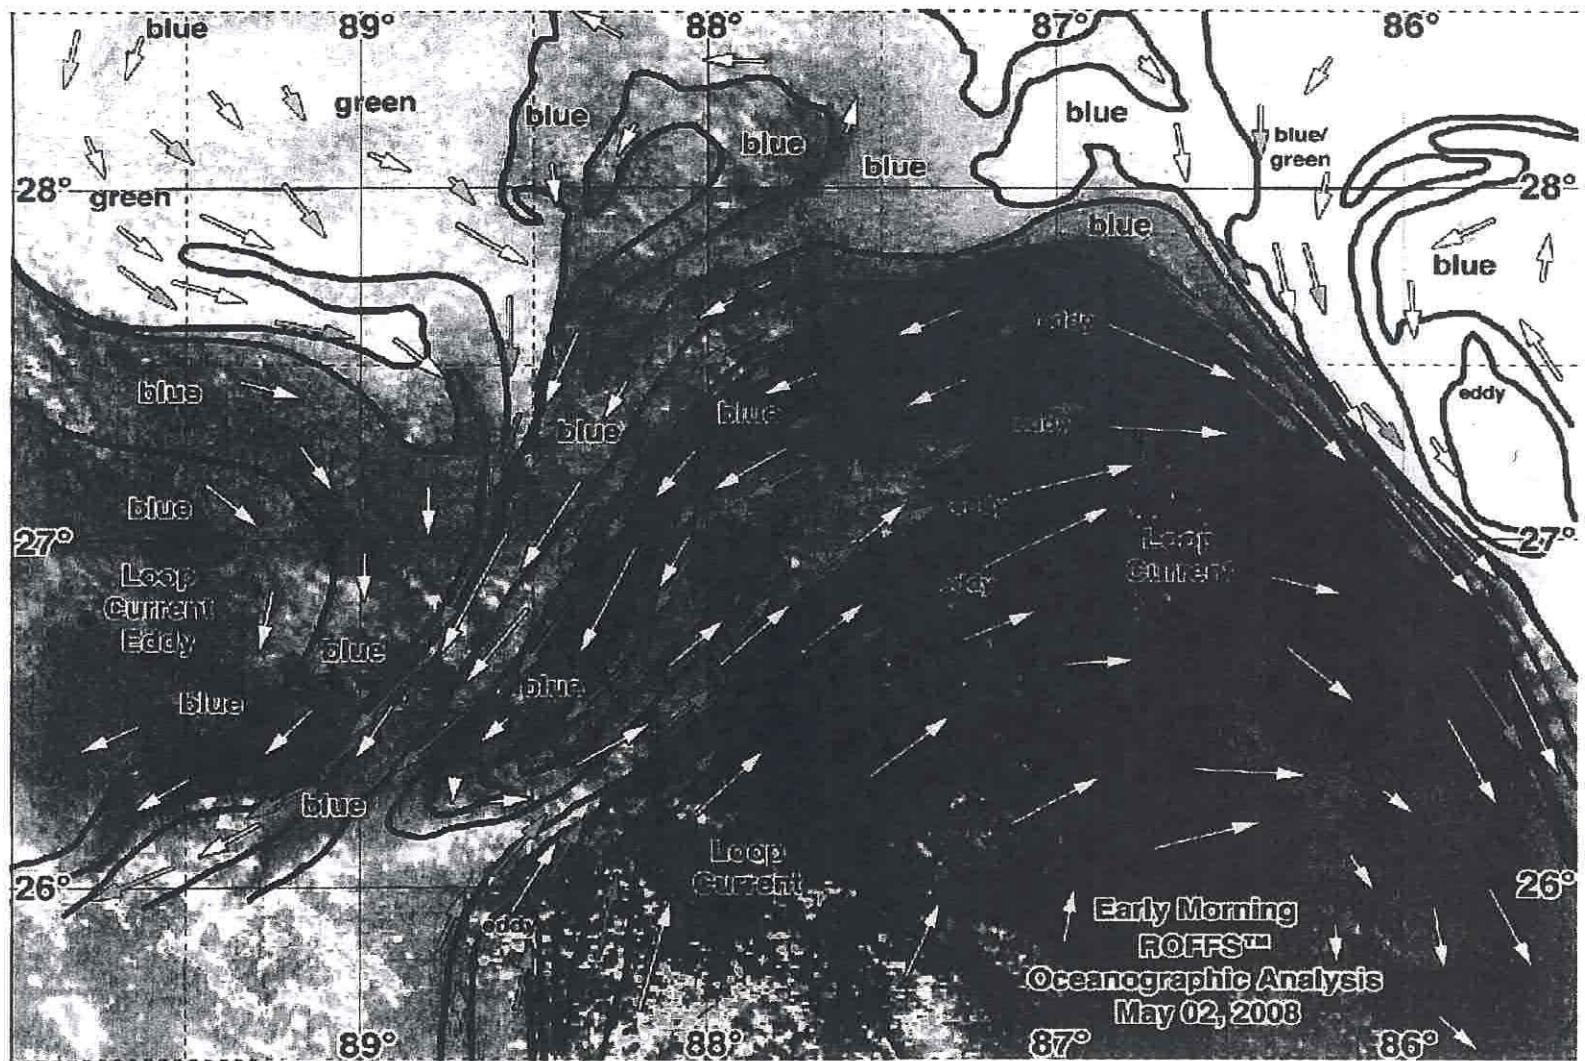

Figure 9. Transect stations (dark purple dots) occupied on 02 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48) plotted on sea surface temperature satellite image.

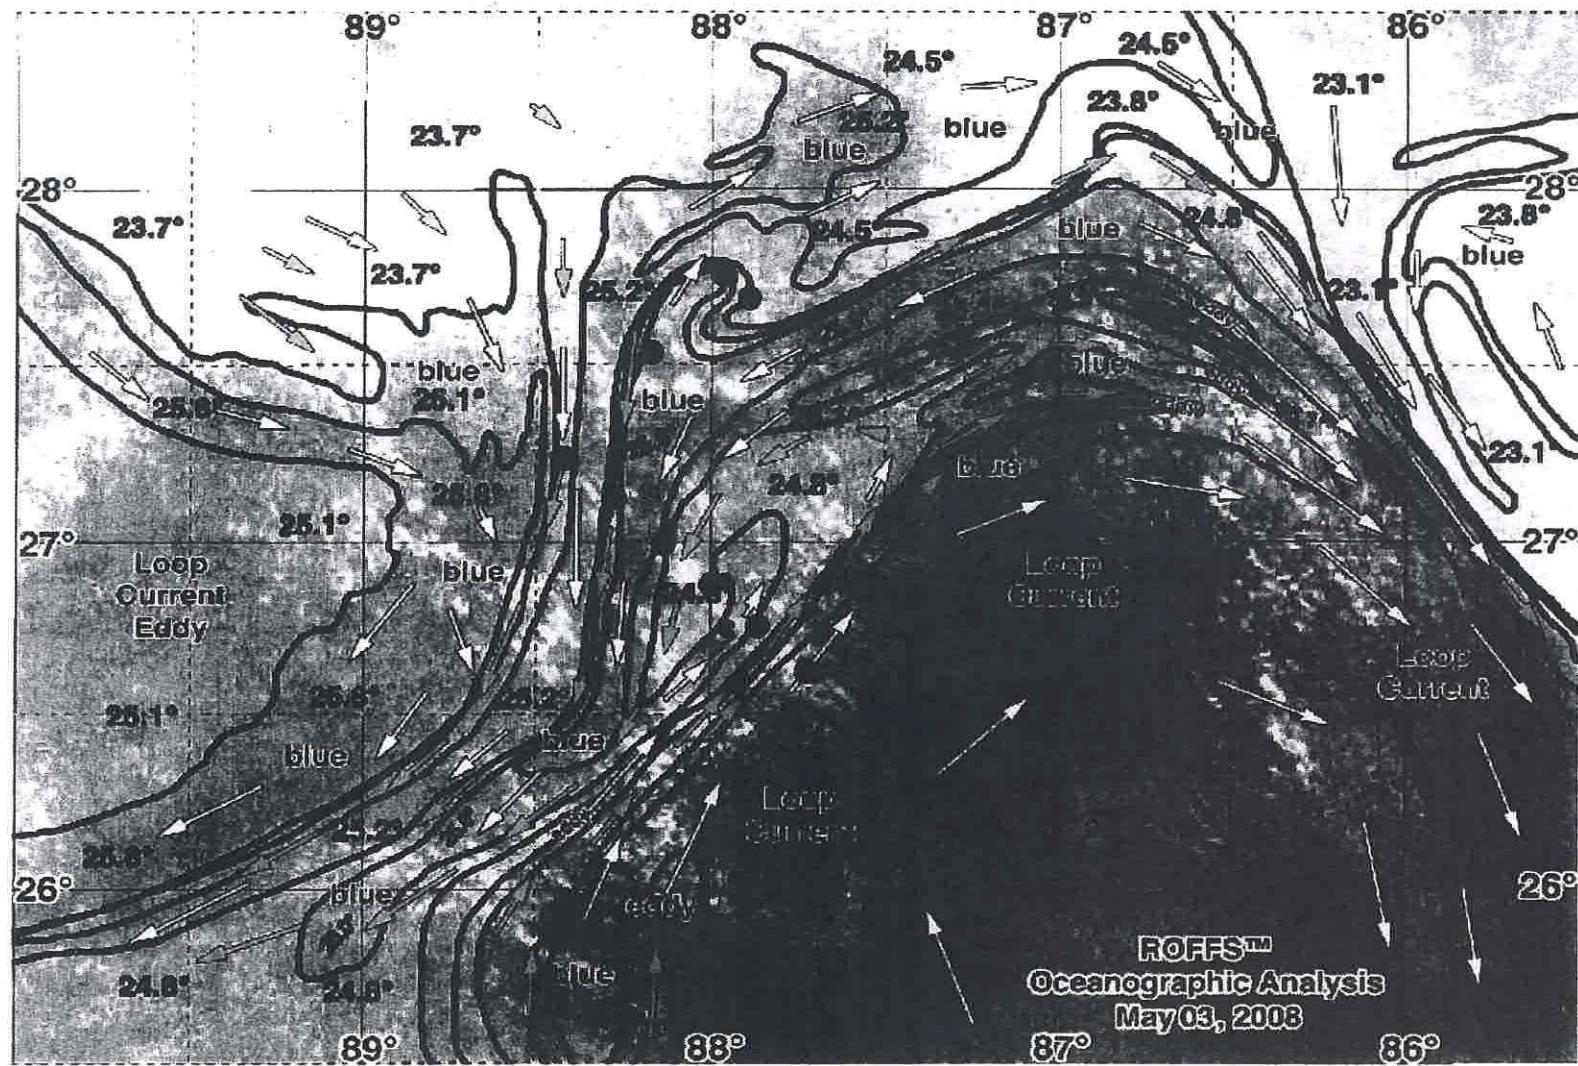

Figure 10. Transect stations (dark purple dots) occupied on 03 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48) plotted on sea surface temperature satellite image.

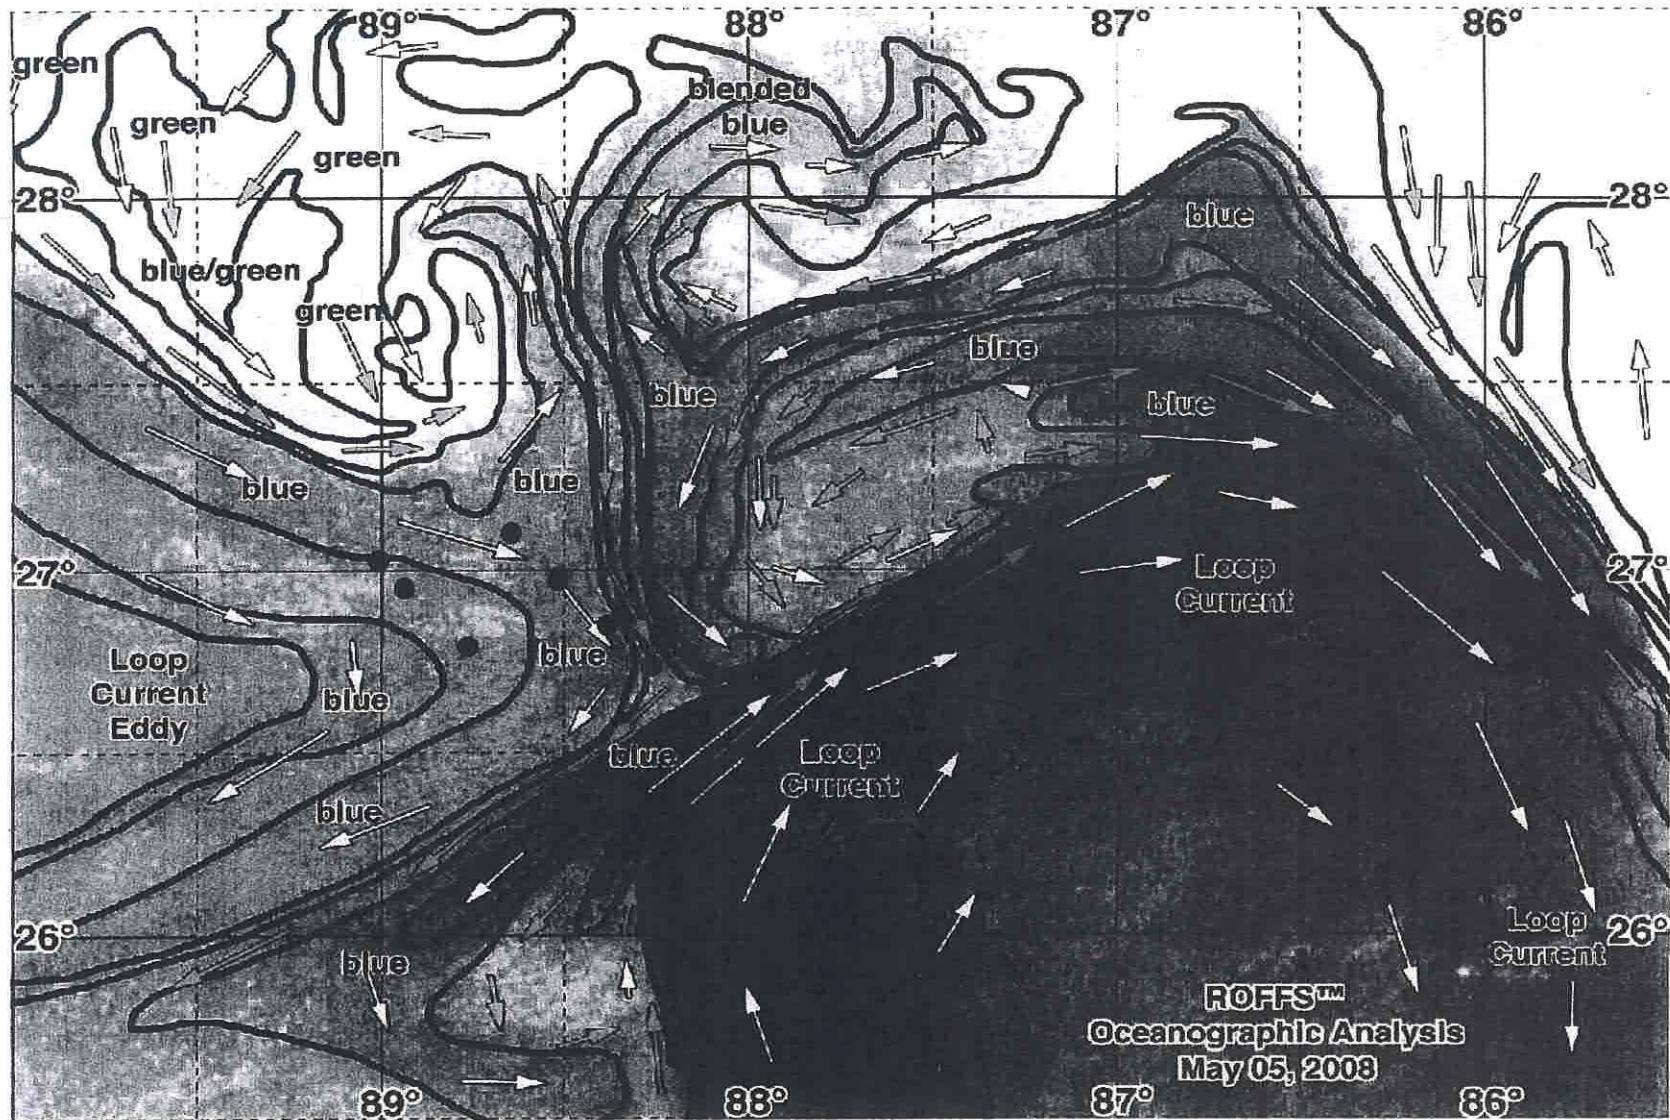

Figure 11. Transect stations (dark purple dots) occupied on 04 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48). Stations were plotted on early morning 05 May 2008 satellite imagery due to not receiving 04 May 2008 sea surface temperature satellite image.

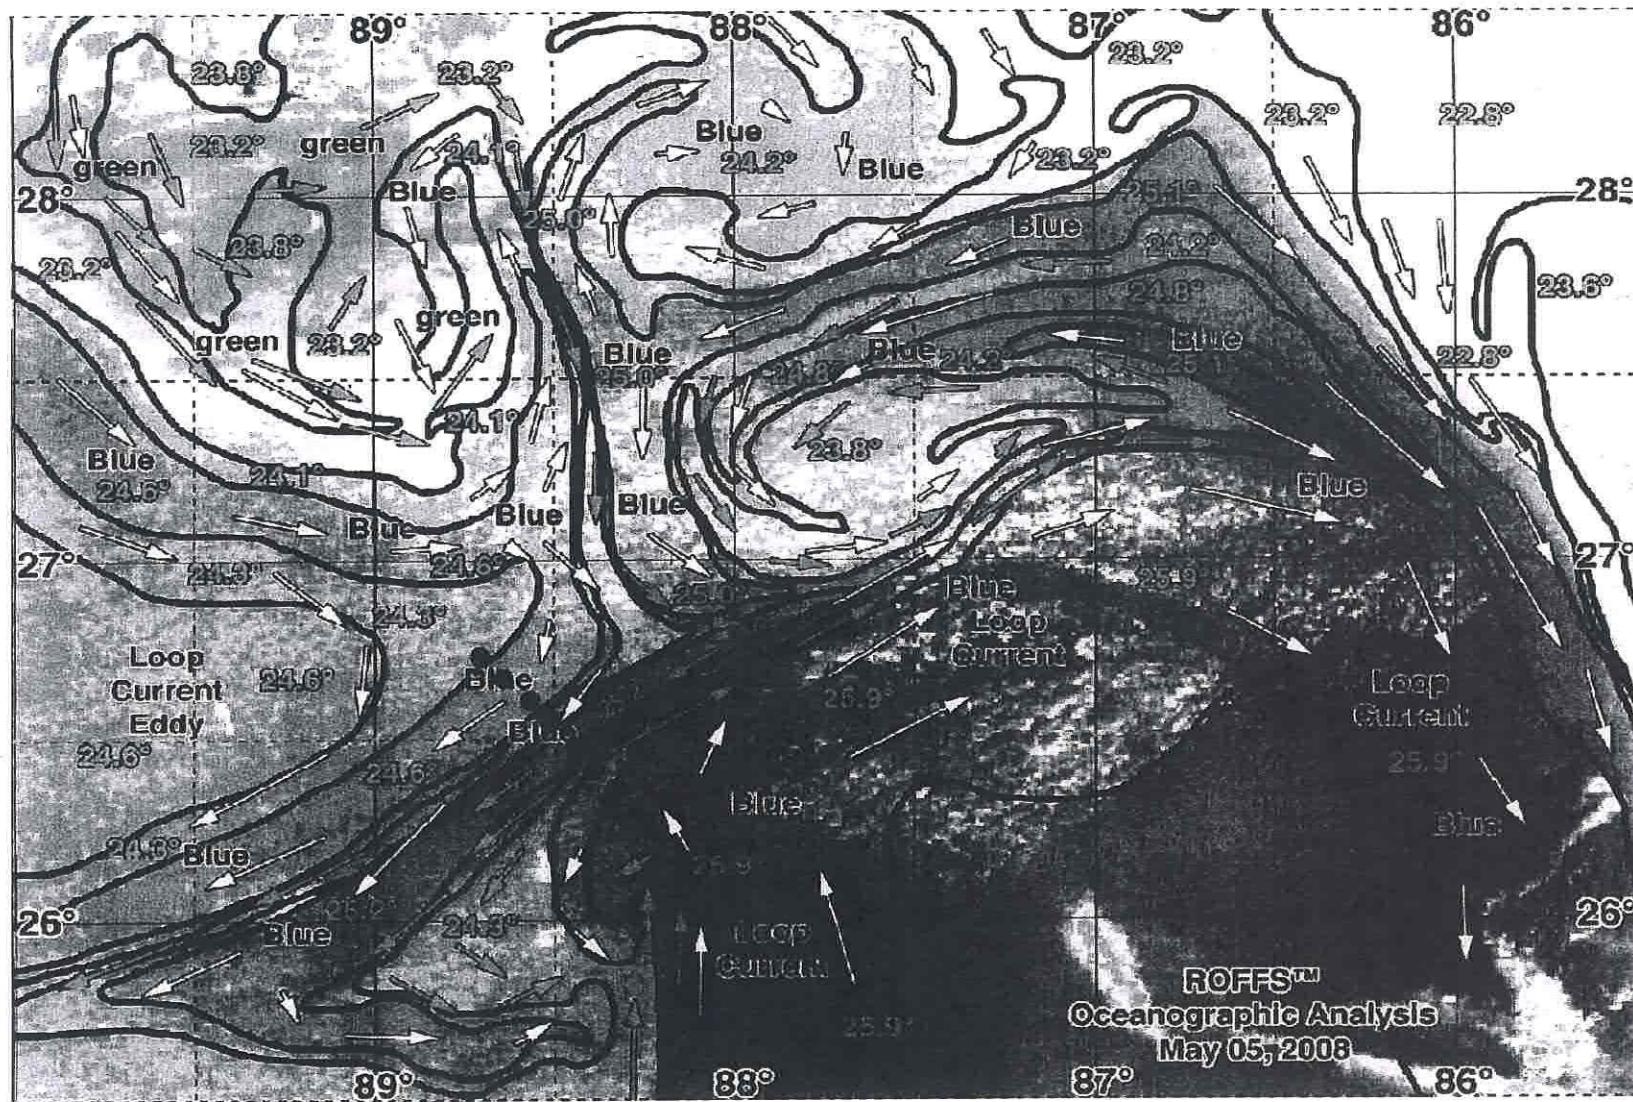

Figure 12. Transect stations (dark purple dots) occupied on 05 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48) plotted on sea surface temperature satellite image.

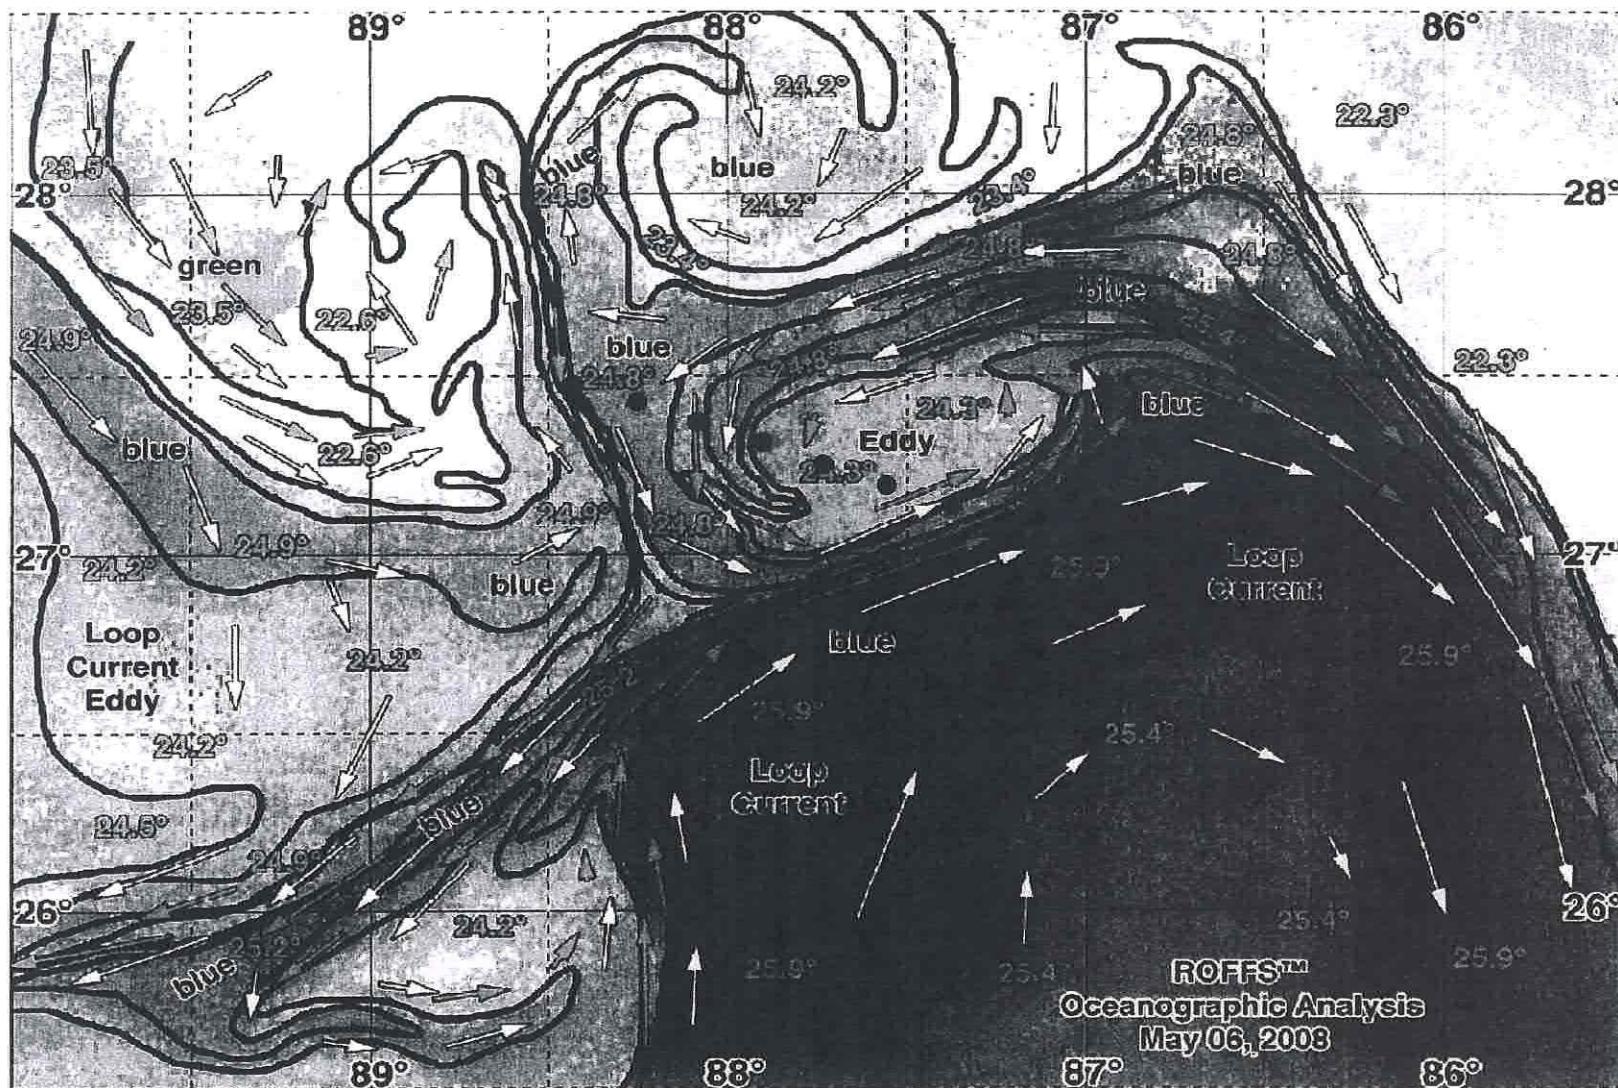

Figure 13. Transect stations (dark purple dots) occupied on 06 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48) plotted on sea surface temperature satellite image.

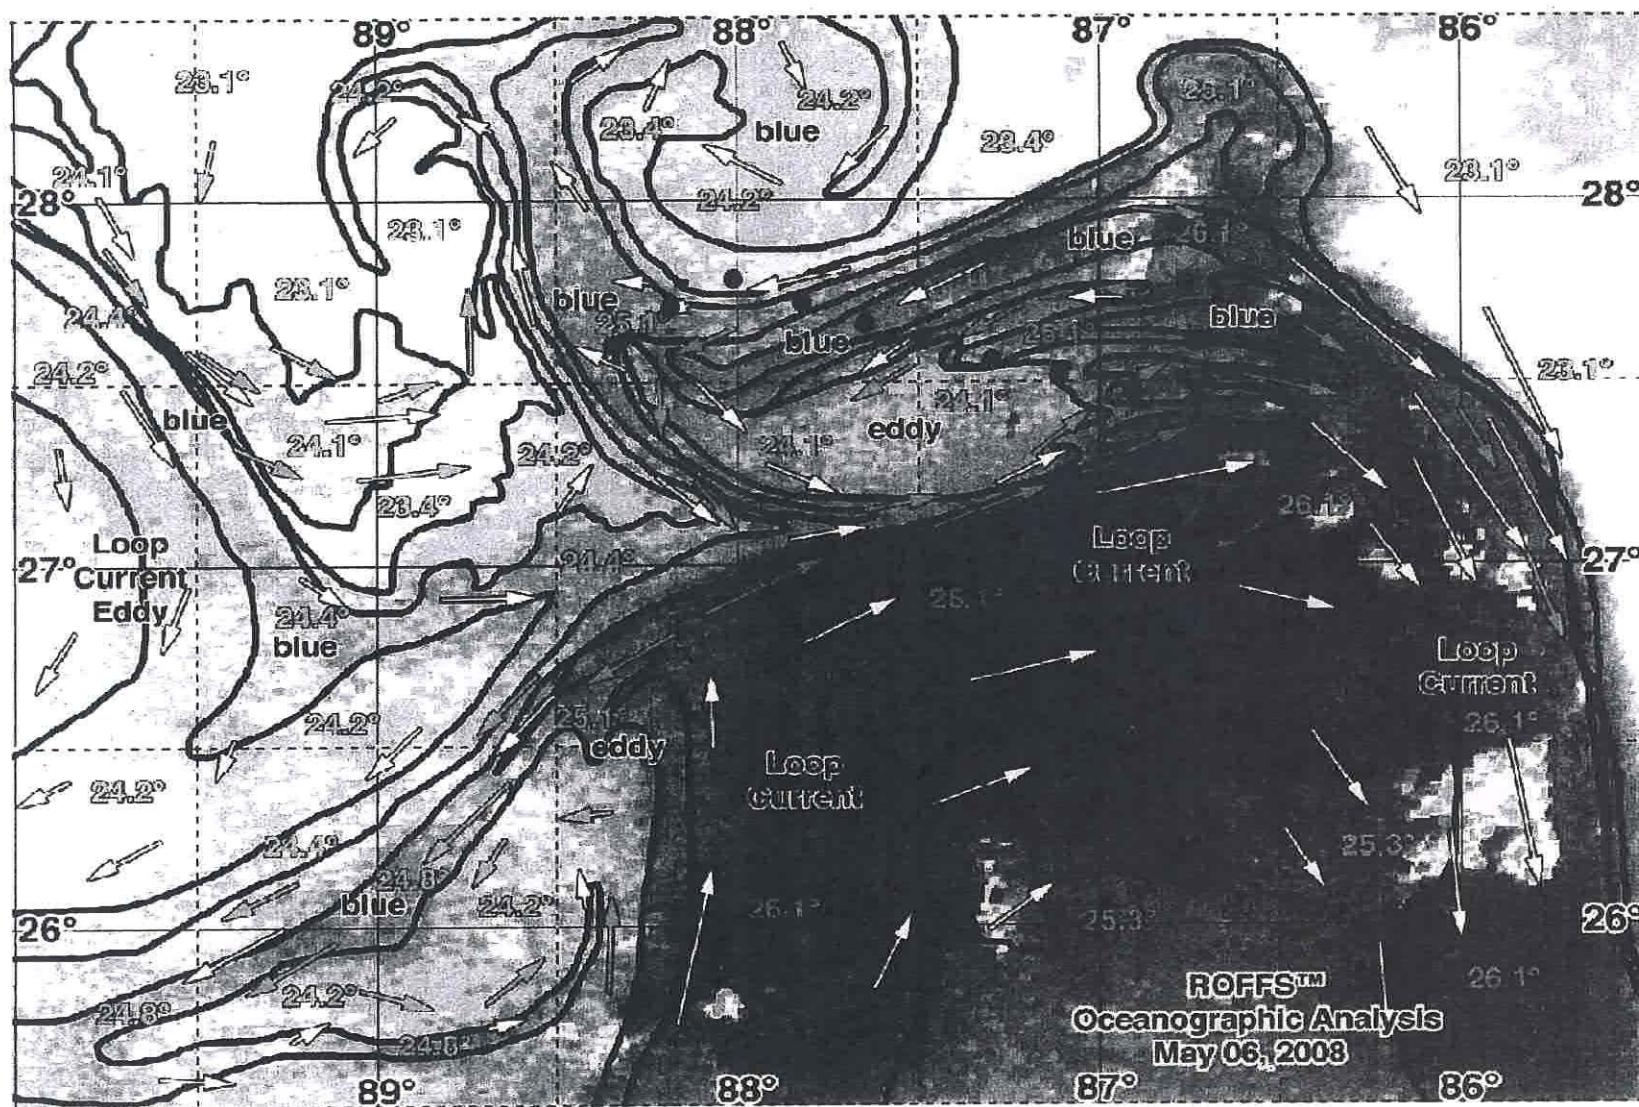

Figure 14. Transect stations (dark purple dots) occupied on 07 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48) plotted on sea surface temperature satellite image. Date on image is incorrect.

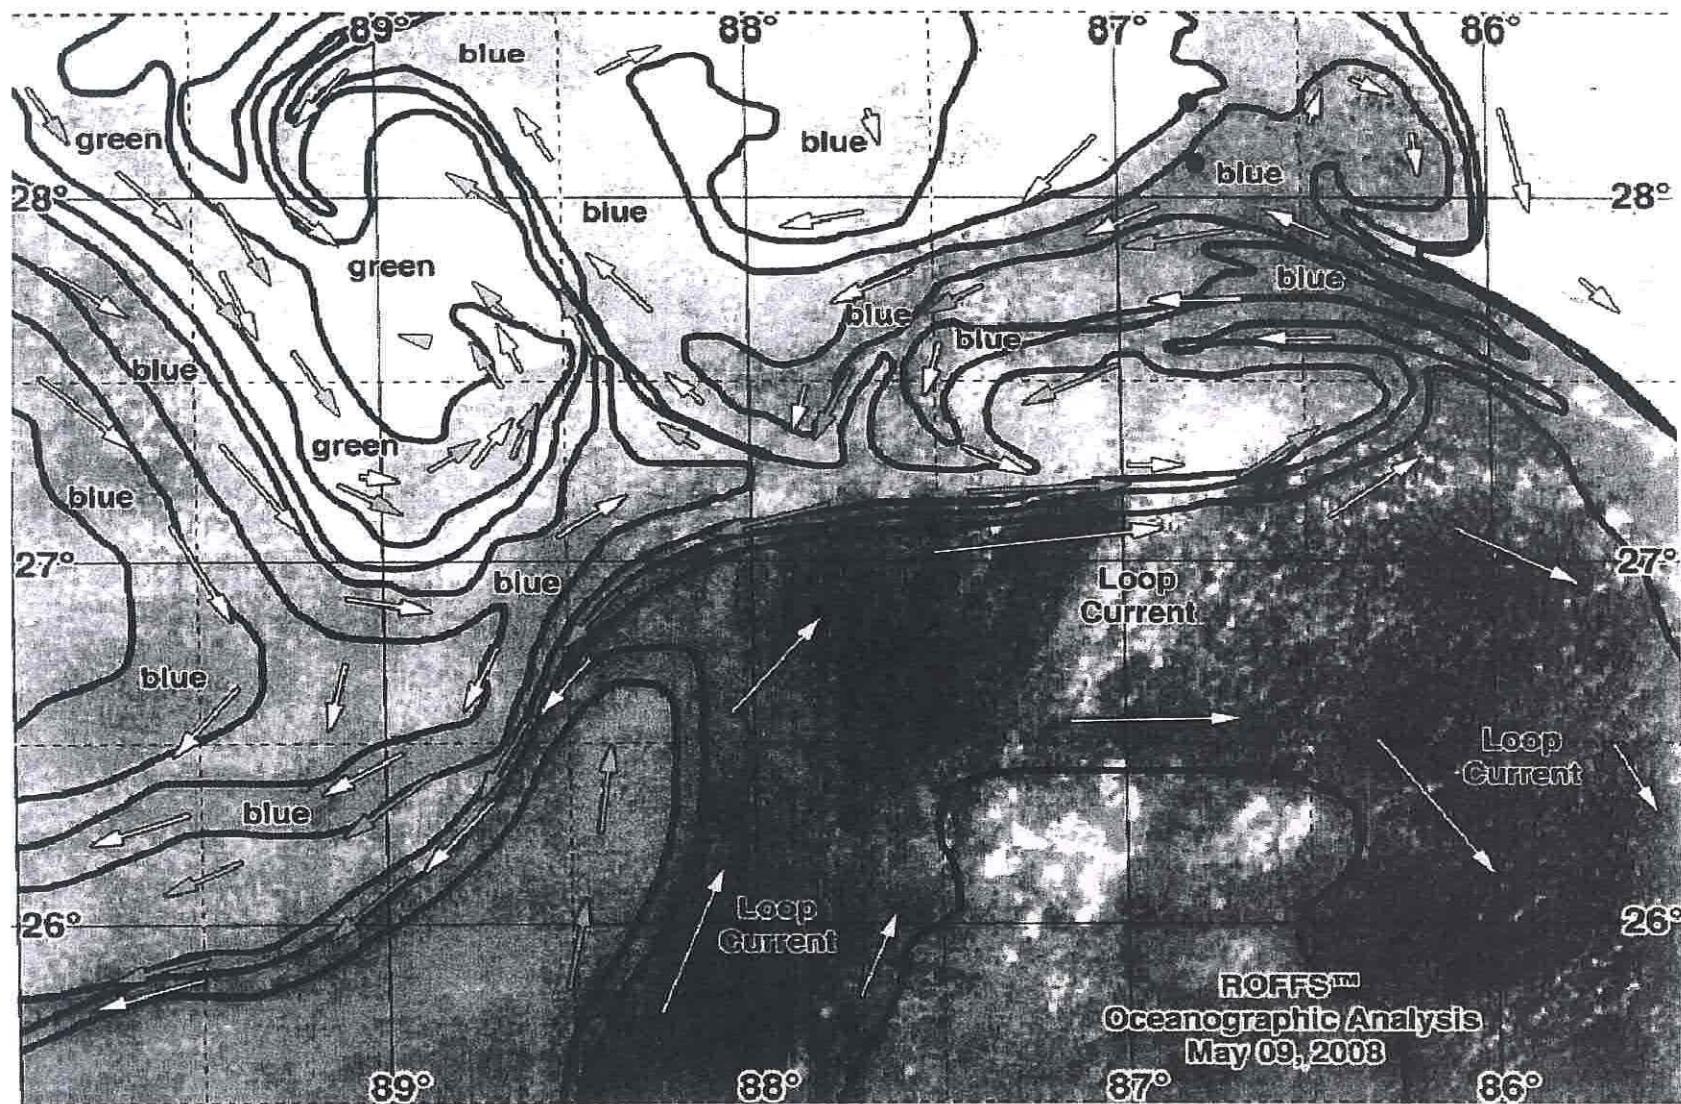

Figure 15. Transect stations (dark purple dots) occupied on 08 May 2008, Leg 1 of the NOAA ship *Gordon Gunter* cruise GU-08-02 (48). Stations were plotted on early morning 09 May 2008 satellite imagery due to not receiving 08 May 2008 sea surface temperature satellite image.
