SEAMAP Fall Shrimp/Groundfish Survey, *R/V Tommy Munro* Cruise 0906 – East Delta Stations

Introduction - The East Delta Fall Shrimp/Groundfish Survey cruise was conducted from October 2, 2009, through October 5, 2009. A total of 16 day and 11 night trawl stations were sampled, with tow times ranging from 10 to 30 minutes depending on depth strata coverage. Two SEAMAP plankton stations (B178 & B179) were also sampled during the cruise.

Objectives

- Conduct fall trawl survey in East Delta region at randomly-selected stations (locations of which are provided by NMFS) with standard SEAMAP 40-ft trawls to collect information on shrimp and groundfish abundance and distribution.
- Process all species (identified to the species level) collected by 40-ft trawl using the FSCS software for total number and total weight. Process individual lengths and weights, sampled (or sub-sampled) by species, using FSCS software according to the SEAMAP Operations Manual.
- Collect information on physical-chemical and environmental parameters in conjunction with trawl sampling and process those using SCS software.
- Submit data to the Gulf States Marine Fisheries commission/NMFS Data Manager.

Methods - All trawl samples were collected aboard the *R/V Tommy Munro*. A 40 ft. trawl with 1.58 inch stretched mesh was lowered into position at selected stations, and the towline was set at a 3.5:1 cable length to water depth ratio. Trawling was conducted at or near 3 knots for a period of 10 to 30 minutes after lockdown in order to sample the appropriate depth stratum. Sample and data processing was conducted in accordance with the SEAMAP Operations Manual. Data were entered using the Fisheries Scientific Computer System. Environmental data were collected in conjunction with each trawl. Temperature, dissolved oxygen, and salinity values were measured and recorded, along with meteorological conditions.

Results – An expanded total of 35,509 organisms were collected in 27 trawl samples. Time, location, depth and hydrology data are presented in Tables 1 and 2; catch data are given in Table 3.

Deviations - There were no deviations from standard SEAMAP protocol. However, for SEAMAP Station ED11 (Station 17024), total catch weight had to be estimated by the scientific and deck crews due to a loss of a large amount of biomass which spilled out of the trawl mouth before the net could be hauled aboard. According to the shift leader, the initial trawl catch extended forward of the 'lazy line' used for hauling the trawl on board. When the crew attempted to haul the net aboard in the rough seas associated with that particular station, a large portion of the trawl catch was lost to the sea. The estimated total catch weight was used as an expansion index to obtain total estimated species-specific weights and numbers, extrapolated from the assumedly representative portion of the trawl that was processed on board.
